Reflection: I am entirely new to vims and so everything I see in the cheatsheet is new. I think it's interesting how many ways there are to close a file though!

Chinook and SSH:

Reflection:

Was this lab easy, standard or difficult?

- The lab was about standard. There was so much I had never seen before and had no clue how to work that people who already know what github, ssh, and chinook are probably found this very easy. I was not one of those people.

Approximately how long did you spend on the entire lab?

- I spent about five hours, all told.

What, if any, tasks did you find the most difficult?

- I found the SSH stuff most difficult. It was pretty unclear and the guides online were pretty contradictory (wanting you to do things in many different ways, mostly).

Did you learn anything new?

- I have learned a ton of new stuff in this lab!

Can this lab be updated or modified in any way to make things easier, or more challenging?

- Maybe more SSH guidance could help, I was pretty lost there a few different times.
